

The SMC Gateway is a small Linux based computer which interfaces digital radio networks with other systems and runs applications tailored to that system; be it a fire alarm, GPS tracker, a security system or just the internet.

The unit can run multiple applications, think of it like a Smartphone without the screen but for radio networks. Some applications are built in, and others can be uploaded. However there's also an option to use the built-in interface for customer creation of new applications, the limits are boundless!

Radio Systems Supported Include:
